ATU VIRTUAL INTERNSHIP

SOFTWARE DEVELOPMENT INDIVIDUAL MINI PROJECT

Student Study Planner Web Application

Project task

Design and build a simple web application that helps a student keep track of study tasks and assignments. The application should let a user add tasks, see the task list, mark tasks complete, and remove tasks.

Project information	Details
Work type	Individual beginner project
Recommended tools	HTML, CSS, and JavaScript, or the tools taught in the lesson
Submission	One project report/document plus working application and source-code links
Deadline	Sunday, 1 November 2026 at 11:59 p.m.

Calendar note: October 31, 2026 is a Saturday. This brief uses Sunday, November 1, 2026 as the deadline.

1. Purpose

This mini project gives you practice applying a simple software development process: understand a problem, plan a solution, build it, test it, and publish it online. Keep the system small and make sure its main features work.

2. Required features

• Add a task with a task title and subject or course name.

• Display saved tasks in a clear list.

• Mark a task as complete and change it back to incomplete.

• Delete a task.

• Keep tasks saved after the page is refreshed. Browser local storage is sufficient.

• Show a helpful message when the task list is empty and do not accept a blank task title.

3. Keep the project within scope

A login system, online database, payment feature, or external API is not required. You may add one small extra feature, such as a priority label or a filter for completed tasks, after all required features work.

PROJECT INSTRUCTIONS AND SUBMISSION

4. Suggested steps

1. Describe the problem in two or three sentences and identify the main user: a student who wants to organise study tasks.

2. Write a short list of what the app must do. Sketch the screen on paper before coding.

3. Build the page using the language and tools covered in the lesson. Start with adding and displaying tasks.

4. Add completion, deletion, input validation, and saving after refresh.

5. Test the required features using the checklist below. Correct any problems you find.

6. Publish the finished app using a suitable free host, such as GitHub Pages or Netlify. Put the source code in a GitHub repository.

5. Minimum testing checklist

Test	Expected result
Add a task with a title	The task appears in the list.
Submit an empty title	The app asks for a title or prevents submission.
Mark a task complete	The task is visibly marked complete.
Delete a task	The task is removed from the list.
Refresh the page	Previously saved tasks remain visible.

6. What to submit

Submit one PDF or document (about 2–4 pages) containing:

• Your name, project title, and a short problem statement.

• A brief list of the required features you implemented and a simple screen sketch or screenshot.

• Your testing checklist with the actual result for each test.

• A short reflection: one challenge, how you addressed it, and one improvement you would make next.

• The live application URL and the GitHub repository URL.

Also make sure the application opens from its live URL and that the GitHub repository contains the project source files. Do not include passwords, private keys, or other secrets in the repository.

7. Marking guide - 30 marks

Assessment area	Marks
Problem understanding and simple plan	4
Screen design and ease of use	4
Required features work correctly	10
Testing and corrections	4
Live deployment and GitHub source link	4
Report, reflection, and clear presentation	4
Total	30

8. Academic integrity

Complete your own project and be prepared to explain how it works. You may consult lesson notes and documentation. If you use code or other material from an outside source or an AI tool, identify that assistance in your report and make sure you understand the submitted work.

Submit through the class submission channel specified by your instructor before the deadline.
